

RFC-0001

Searchlores Core Concepts

Version: Draft 0.1

Status: Experimental

Author: Searchlores Academy

Abstract

This document defines the core conceptual model of Searchlores.

Searchlores is a cognitive reconnaissance framework designed to transform questions into structured investigations.

The purpose of this RFC is to establish a common vocabulary and ontology for all Searchlores implementations.

1. Fundamental Principle

The fundamental unit of Searchlores is not the Answer.

The fundamental unit of Searchlores is the Investigation.

An Investigation is a structured exploration of a subject intended to reveal:

- assumptions
 - contradictions
 - narratives
 - sources
 - uncertainties
 - search vectors
-

2. Subject

Definition

A Subject is the initial object of investigation.

It represents the starting point of inquiry.

Examples

Large Language Models

Climate Change

The Roman Empire

Linux

Cryptocurrency

Properties

```
subject:
  id:
  title:
  description:
```

3. Investigation

Definition

An Investigation is a structured container holding all knowledge generated during exploration.

Properties

```
investigation:
  subject:
  assumptions:
```

contradictions:

myths:

vectors:

narratives:

sources:

questions:

notes:

Requirements

Every Investigation **MUST** contain:

- one subject

Every Investigation **SHOULD** contain:

- at least one vector

Every Investigation **MAY** contain:

- assumptions
- contradictions
- narratives
- myths

4. Assumption

Definition

An Assumption is a proposition implicitly accepted without examination.

Examples

AI understands language.

Experts are objective.

Economic growth is desirable.

Purpose

Assumptions define invisible boundaries around inquiry.

Searchlores attempts to expose them.

Properties

assumption:

statement:

confidence:

origin:

notes:

5. Contradiction

Definition

A Contradiction is an incompatibility between two or more propositions.

Examples

AI understands language.

AI merely predicts tokens.

Purpose

Contradictions indicate:

- unresolved questions
- competing models
- paradigm conflicts

Properties

```
contradiction:  
  
  statement_a:  
  
  statement_b:  
  
  severity:  
  
  notes:
```

6. Myth

Definition

A Myth is a culturally accepted proposition that functions primarily as a narrative simplification.

A Myth may be:

- true
- false
- partially true

Truth status is not required.

Examples

```
AI thinks.  
  
Technology is neutral.  
  
Data speaks for itself.
```

Properties

```
myth:  
  
  statement:  
  
  prevalence:
```

origin:

7. Search Vector

Definition

A Search Vector is a direction of investigation.

Vectors expand inquiry into multiple dimensions.

Examples

History

Economics

Politics

Psychology

Technology

Law

Purpose

Vectors prevent premature convergence.

Properties

vector:

name:

description:

priority:

8. Source

Definition

A Source is an identifiable origin of information.

Types

- Primary
- Secondary
- Tertiary

Examples

Academic paper

Book

Forum archive

Interview

Official document

Properties

source:

title:

author:

date:

type:

reliability:

9. Narrative

Definition

A Narrative is a structured story used to explain reality.

Narratives influence interpretation.

Examples

Technology will save humanity.

Technology will destroy humanity.

Properties

narrative:

title:

protagonists:

antagonists:

promises:

omissions:

10. Question

Definition

A Question is an unresolved inquiry generated during investigation.

Types

- Initial
- Derived
- Adversarial
- Open

Examples

Who benefits?

Who loses?

What assumptions exist?

Which evidence is missing?

Properties

question:

text:

type:

priority:

11. Search Map

Definition

A Search Map is a graph representation of an Investigation.

Components

Nodes:

- subjects
- vectors
- assumptions
- contradictions
- narratives
- sources

Edges:

- supports
- contradicts
- originates_from

- expands_to

Purpose

Transform information into navigable structure.

12. Inquiry Report

Definition

A human-readable representation of an Investigation.

Sections

Subject

Assumptions

Contradictions

Vectors

Questions

Sources

Narratives

Recommendations

13. Lore

Definition

A Lore is a reusable investigation template.

A Lore describes:

- common assumptions
- common myths
- common vectors

- common contradictions

for a specific domain.

Examples

```
llm.lore
```

```
linux.lore
```

```
economics.lore
```

```
history.lore
```

14. Archaeology

Definition

Archaeology is the process of reconstructing hidden structures from visible artifacts.

Types

Prompt Archaeology

Source Archaeology

Narrative Archaeology

Cognitive Archaeology

15. Cognitive Reconnaissance

Definition

The systematic exploration of knowledge domains through structured investigation.

This is the primary activity performed by Searchlores.

Conclusion

Searchlores does not model answers.

Searchlores models investigations.

The purpose of Searchlores is not information retrieval.

The purpose of Searchlores is cognitive cartography.
